Manual: How to Build a Computer, Component by Component

Many people overpay for their computers, and even worse they have no idea what goes into it. Paying thousands of dollars for something which ignorance clouds is a dangerous thing when on a budget. Furthermore, most consumers buy computers with components that are unnecessary or too powerful for what they intend to use it for.

I propose a manual for consumers interested in a new computer which will teach them how to put one together themselves. It will walk them through the process step by step, giving them the confidence to have a great computer for a cheaper price than a store can offer.

Its sections will comprise of:

- Gathering Materials and Tools
- Mounting a Processor
- Mounting the RAM and GPU
- Mounting the Motherboard
- Mounting the Drives
- Installing a Power Supply, and Cabling
- Finishing

Not only would this manual be a great guide for saving someone money on purchasing a computer, but it would also empower them to save money on future computers by educating them in a skill not had by many.
